

13-01 Activities view – Sorting – Interactive column sorting

This example shows how the automatic sorting function can be used according to the values of a selected column.

The sort is a display sort and is only maintained as long as the sort function is active. During this time, however, the sort is dynamic — i.e., changes to the data in the relevant column automatically update the sort order. If there are identical values, the initial order is preserved.

Only one column can be sorted at a time. When switching from one sorted column to another, the sort is applied to the new column. The starting point for sorting is the original order.

To use this functionality, two options must be set to **true**:

```
interactiveSwitchingOfSortOrderEnabled: true,  
sortingIndicatorVisible: true
```

The **interactiveSwitchingOfSortOrderEnabled** option allows sorting by clicking on one of the table columns. However, only the second option, **sortingIndicatorVisible**, provides visual feedback about the sort mode by displaying an arrow: pointing up for ascending sort and down for descending sort.

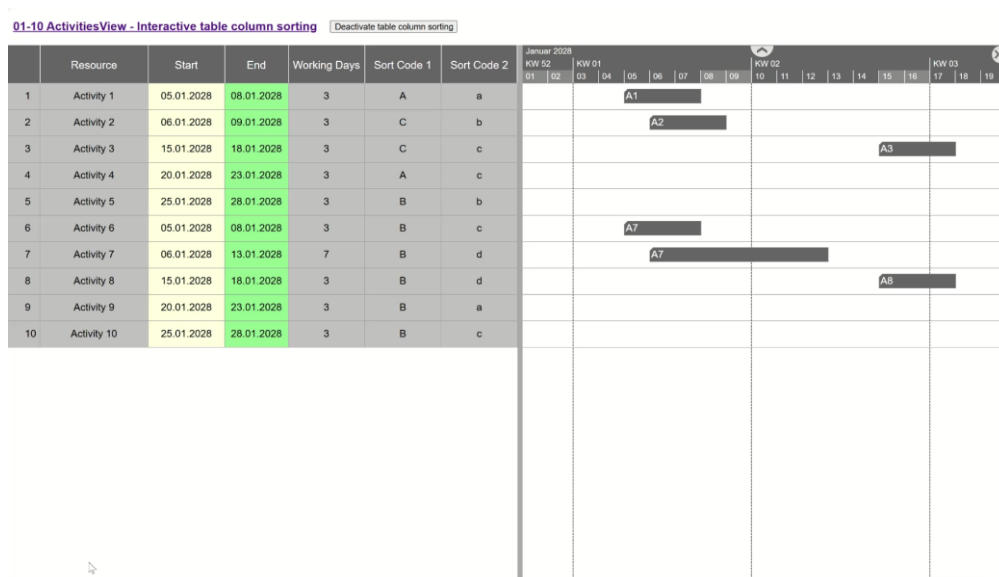

Clicking in the column header (e.g. Start) causes two options to be set automatically:

```
activityRowSortCodePropertyName: "Start",
activityRowSortMode: RowSortMode.Ascending
```

If certain columns are to be excluded from the sorting option, the **cancel** property must be set to **true** for these in the **onRowSortingChangeRequested** callback.

```
onRowSortingChangeRequested: function (args) {
    if (args.sortCodeSource == "Name")
        args.cancel = true;
},
```

```
